

# **Guided Wave Radar Level Transmitter (TDR)**

measuring monitoring analysing

- For liquids and solids
- Independent of density, temperature, pressure, humidity and conductivity
- Measuring length: max. 20 m
- Temperature range: -150...+250°C
- Pressure range: -1 ... + 40 bar
- Output: 4 ... 20 mA, switching output PNP

# Description

NGM uses TDR (Time Domain Reflectometry) technology, which is also known as Guide Microwave or Guided Wave Radar. This means that low-energy and high-frequency electromagnetic impulses, generated by the sensor's circuitry, are propagated along the probe which is immersed in the liquid or solid to be measured.

When these impulses hit the surface of the media, part of the impulse energy is reflected back up the probe to the circuitry which then calculates the level from the time difference between the impulses sent and the impulses reflected.

The sensor can output the analysed level as  $4\dots 20$  mA analogue output, or it can convert the values into freely programmable switching output signal.

# **Application Area**

The innovative TDR technology enables direct, precise and highly reliable continuous level measurement as well as point level detection in almost every liquid and light solids – independent of changing process conditions (such as density, conductivity, temperature, pressure or air humidity). The units can be mounted in small tanks, tall and narrow nozzles and it measures precisely even with difficult tank geometries or close to interfering structures. NGM is also especially suitable in bypass chambers and stilling wells. It has an exceptional performance in media with low dielectric constant (i.e. low reflectivity) such as oils and hydrocarbons.

# Benefits

- Level measurement independent of pressure, temperature, humidity, conductivity
- Suitable for almost all media, liquids and light solids
- Fully modular probe design, i.e. the probe types are interchangeable without any special tools or welding
- Complete galvanic insulation of device electronics from its inputs/outputs and the tank potential (no problems with electrochemical corrosion protection)
- Highly robust measurement due to 4-wire design and innovative signal analysis and disturbance signal suppression

#### **Sensor Components**

NGM consists of three major components: housing, feedthrough, and probe. The only components that are exposed to the atmosphere inside the tank are probe and the part of the feed-through below the hexagon. The housing contains the sensor's electronics and input/output terminals and has no contact with the tank atmosphere. The so called feedthrough is mounted into the bottom of the housing and serves two main purposes: its outer threaded metal bushing securely connects the sensor to the tank and its inner components guide the high frequency measurement signal from the electronics through the tank wall into the tank and back. The probe is mounted onto the bottom of the feedthrough and gets immerged into the media inside the tank; the high-frequency measurement signal is propagated along the probe. NGM has a flexible modular concept. Any probe can be used with any housing since they are joined together by one universal feed-through.

#### Sensor components

# Modular probe design

# **Probe Types**

To meet various application requirements, NGM has three different probe types: single rod probe, wire rope probe and coaxial probe.

#### Single rod (max. 3000 mm)

Single rod probe is suitable for a very wide range of applications, but the signal has a wider detection radius around the rod. Thus, they are more responsive for measurement signal disturbances which can be easily overcome by observing a few mounting considerations and making simple configuration adjustments to the sensor.

The single rod probe is recommended for installations in liquids and in bypass chambers and stilling wells, which basically act together with the rod as a big coaxial probe.

#### Wire rope (max. 20000 mm)

The wire rope probe model NGM-4... is recommended for installations in light solids and liquids, tall tanks and where limited headroom is available.

Wire rope probe is suitable for a very wide range of applications, but the signal has a wider detection radius around the rope, just like single rod probe. Thus, they are more responsive for measurement signal disturbances.

# Coaxial (max. 6000 mm)

In the coaxial probe, the high-frequency measurement signal is completely contained within the outer tube. Thus, the coaxial probe is immune against any external conditions and interfering objects outside its tube which could otherwise cause disturbances of the measurement signal. This makes the coaxial probe the ideal solution for a hassle-free universal installation, ensuring reliable measurement under almost any application condition. The concentrated signal within the tube also makes the coaxial probe the ideal choice for measuring low reflectivity liquids (i.e. low dielectric constant) such as oils and hydrocarbons. The coaxial probe is recommended for the use with clean liquids only and cannot be used with solids, viscous, crystallizing, adhesive, coating, or sticky liquids; fibrous liquids, sludge, slurry, pulp; any liquids containing solid particles. Such liquids or solids in general might cause build-up, bridging or clogging inside the coaxial probe.

# Application Guide

Mounting type/probe type	Rod probe	Wire rope	Coaxial

# **Measuring Range**

The probe length [L] is not equal to the actual measuring range [M] of the sensor. TDR level sensors have small inactive areas at top [L1] and bottom [L2] of the probe. Those are due to the presence of unavoidable signal disturbances at both ends of the probe. In these inactive areas the measurements are nonlinear or have reduced accuracy. Therefore, it is not recommended to actually measure level within those inactive areas. Their length depends on the probe type and the reflectivity (i.e. dielectric constant) of the liquid/solid to be measured (see table below). The measuring range [M] of should be between the top and bottom inactive areas of the probe. The location of the switching point [S] of the switching output can also be freely positioned within the measuring range [M]. Fixed hysteresis or separate upper and lower thresholds can be defined for the switching output.

	ε <sub>r</sub> = 80			
[mm]	Rod probe Wire rope		Coax	
L1 (top) 50		50	30	
L2 (bottom)	10	10	10	
ε <sub>r</sub> = 2				
L1 (top)	80	80	50	
L2 (bottom)	50	50	50	

Factory adjustment: L1 = 50 mm, L2 = 10 mm; S = 0.2 L from top, hysteresis = 3 mm, NC

# **Mounting Considerations**

Mounting type/ Probe type	Rod probe	Wire rope	Coaxial
Nozzle diameter	> 50 mm	> 50 mm	ø >17.2 mm
Nozzle height	< 300 mm	< 300 mm	no restrictions
Clearance to tank wall or other internal objects	> 100 mm	> 100 mm	no restrictions
Clearance between probe end and tank bottom	> 2 mm	> 2 mm	no restrictions
Diameter of bypass chamber/ stilling well (only for liquids)	> 25 mm	> 25 mm	ø >17.2 mm*

\*There should be enough room around the probe for the liquid to flow in and out of the bypass chamber/stilling well

# **Electrical Connection**

NGM is a 4-wire system i.e. a set of 2 wires for the power supply and separate sets of 2 wires for each output. The electronic is galvanically completely insulated from its inputs/ outputs and the tank potential, thus avoiding any problems from electrochemical corrosion protection of the tank.

Basic configuration of the devices can be done directly on the device via a DIP switch, a single push button and visual feedback from an LED. For greater convenience, a simple EXCEL spread sheet is provided through which remote configuration and extensive diagnostics can be done. A standard HART<sup>®</sup> modem e.g. HARTCOMM is required for communication between computer and sensor.
